RaceDay Database Schema

PROG6212 POE — Section C: SQL Script Execution Evidence

Successful Execution of the RaceDay Database CREATE Statement

The screenshot below shows the RaceDay_DB.sql script being executed in SQL Server Management Studio (SSMS) against a fresh instance. In Figure 1, the database creation statement (CREATE DATABASE RaceDayDB) is highlighted in green, and the Messages pane confirming "Commands completed successfully" is highlighted in red, demonstrating that the script ran without errors.

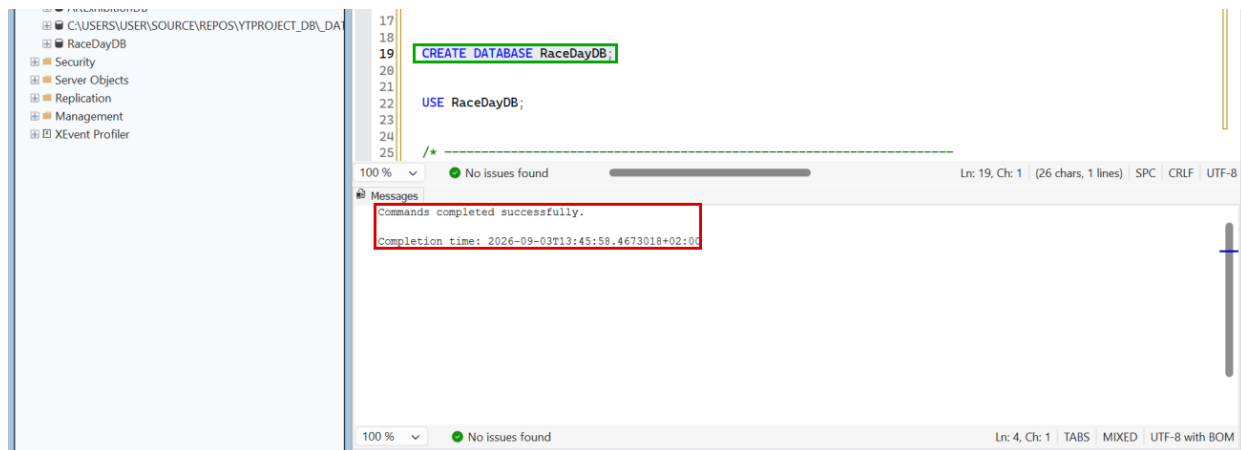

Figure 1: Successful execution of the RaceDay database creation script in SSMS

Successful Execution of the RaceDay Database USE Statement

Figure 2 shows the successful execution of the RaceDay database USE statement in SQL Server Management Studio (SSMS). The SQL statement is highlighted in the green box, while the message in the red box confirms that the command was executed successfully. This indicates that the RaceDay database was selected and is ready for the next SQL operations.

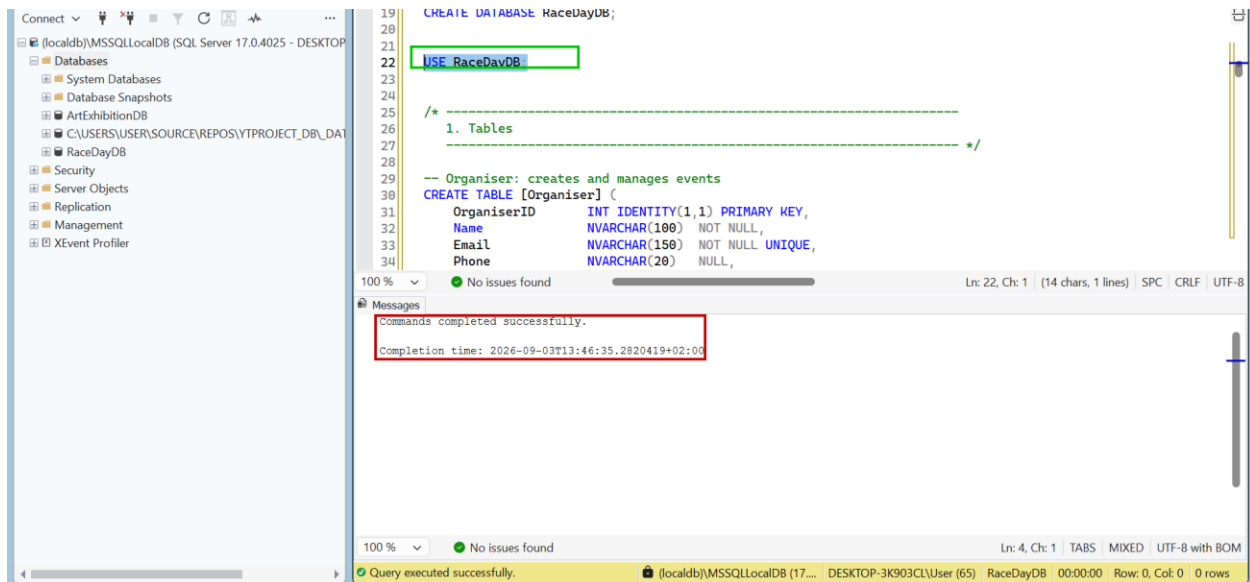

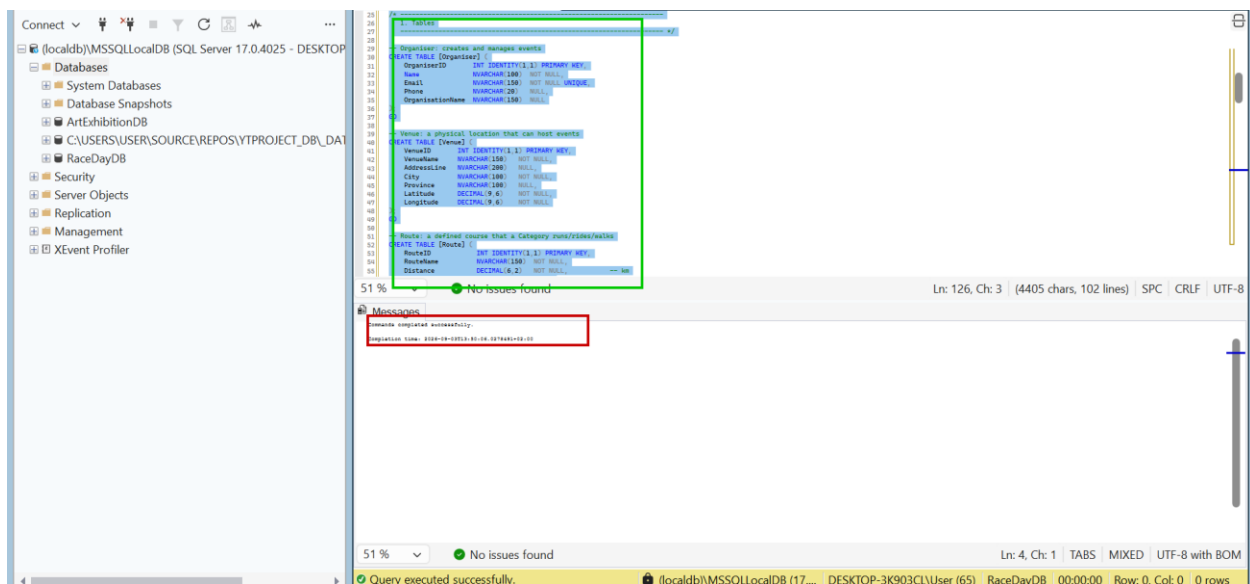

Figure 2: Successful execution of the USE RaceDay database script in SSMS

Execution of All Database Tables

Figure 3 shows the successful execution of all the tables in the RaceDay database. The tables include Venue, Event, Category, Organizer, Participant, Entry, Route, and Result. These tables are connected using primary keys and foreign keys based on the relationships between them. This allows the different tables to work together and helps keep the database organized.

Tables with Relevant Data

Figure 4 shows the tables that were created in the RaceDay database in the SSMS interface. The tables contain relevant data that will be used by the database, such as information about venues, events, categories, organizers, participants, entries, routes, and results. This shows that the tables have been successfully created and are ready to store and manage the required information.

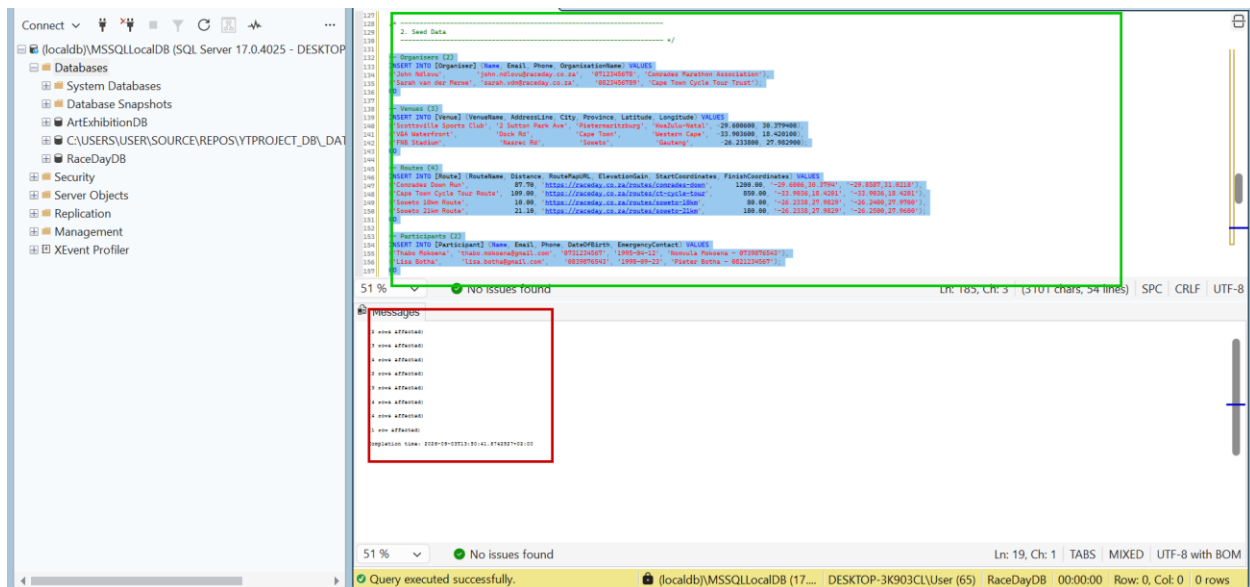

Figure 3: Successful execution to INSERT to seed All Database Tables for the RaceDay database in SSMS

Object Explorer Showing All Tables

Figure 5 shows the Object Explorer in SSMS after the database was refreshed. All eight tables are displayed, confirming that the tables were created successfully. This shows that the RaceDay database structure has been set up correctly.
